Xhol; Stress condition II library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP [WH4+ - containing) and shifted to TAP - NO3- [24hrs]; H2 production conditions (0, 12hr, 24hr) see Melis et al., (2000) Plant Phys. 122: 127-135; TAP + H2O2 (1, 12, 24 hr); TAP + Sorbitol (1, 2, 6, 24 hr) and MRA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhoRI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al., (1996) Genome Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       B1727879 584 bp mRNA linear BST 19-SEP-2001 1031095C12.yl C. reinhardtii CC-1690, Stress II (normalized), Lambda Zap II Chlamydomonas reinhardtii cDNA, mRNA sequence.

PolyA mRNA was purified from each sample, pooled and CDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the BCORI (5′) and XhOI (3′) sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

/wol type="mkNA"
/wormalized), Lambda Zap II"
/wolne lib="C. reinhardtii CC-1690, Stress II
/wormalized), Lambda Zap II"
/woll Stress condition II library, constructed by John
Davies and Jeffrey McDermott, combines cDNAs from CC-1690
cells grown to mid-log phase in TAP (kM4+ - containing)
and shifted to TAP - NO3- (24hrs); H2 production
conditions (0, 12hr, 24hr) see Melis et al., (2000) Plant
Phys. 122: 127-135; TAP + H3C2 (1, 12, 24 hr); TAP +
sorbitol (1, 2, 6, 24 hr); TAP + Cd (1, 2, 6, 24 hr)
Polyh mRNA was purified from each sample, pooled and cDNA
synthesized The cDNA was directionally cloned into lambda
Zap II (Straagene) in the Econt (5, and Xhoxi (3')
sites. pBluescript II SK- plasmids were excised from the
lambda ZAP clones by superinfection with ExAssist
(Straagene) phage. The library was normalized using
method 4 describbed."
Research 6: 791-806."

Purifying recombinant hepatitis C virus (HCV) B1 and B2 envelope proteins - in presence of disulphide bond cleavage agent, to produce proteins suitable for direct use in vaccines or diagnostic assays of HCV.

Claim 23; Fig 21; 146pp; English.

and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) E1

                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed BI. R2 and BI/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AGGAACGCCAGCGTCCCCAACGACAATACGACGCCACGTCGATTTGCTCGTTGGGGCT
